In summary, based on evidence from both humans and animal models, we believe that plant sterol levels in plasma are not related to increased CHD risk.

Conflict of Interest Disclosures: All authors have completed and submitted the ICMJE Form for Disclosure of Potential Conflicts of Interest. Dr Jones reported receiving grants from the Canadian Institutes of Health Research (CIHR), Canada Research Chair Endowment (CRCE) of the Federal Government of Canada, Advanced Foods and Materials Network (AFM Net), Danone, Enzymotec, and Unilever. Dr Jones also serves as president of Nutritional Fundamentals for Health, which markets plant sterols among other nutraceuticals. Dr Ramprasath reported receiving grants from CRCE of the Federal Government of Canada, CIHR, AFM Net, Loblaw Brands, Solae, and Unilever. Dr Frohlich reported no disclosures.

RESEARCH LETTER

Canned Soup Consumption and Urinary Bisphenol A: A Randomized Crossover Trial

To the Editor: Human exposure to bisphenol A (BPA) is widespread. In adults, urinary BPA concentrations are positively associated with cardiovascular disease and diabetes. Exposure occurs primarily through the diet. Bisphenol A has been quantified in many canned goods, where it is present as a by-product of interior epoxy coatings used to prevent corrosion. We hypothesized that canned soup consumption would increase urinary BPA concentrations relative to fresh soup consumption.

Methods. In 2010, we recruited Harvard School of Public Health (HSPH) student and staff volunteers (aged >18 years) via informational fliers and e-mail. The study was approved by the HSPH institutional review board. Written informed consent was obtained.

We used a randomized, single-blinded, 2 X 2 crossover design. For the first 5-day period (October 25-29, 2010), one group consumed a 12-ounce serving of fresh soup (prepared without canned ingredients) daily between 12:15 and 2 PM; the other group consumed a 12-ounce serving of canned soup (from 18.5-ounce Progresso brand) per the same schedule. After a 2-day washout, treatment assignments were reversed (November 1-5, 2010). We used 5 different...
varieties of vegetarian soup per treatment and repeated them in the same order the following week. Participants were not restricted in their consumption of other foods.

Donation of spot urine samples took place between 3 and 6 PM on the fourth and fifth days of each phase. Urine was collected in polyethylene containers and stored in polypropylene cryogenic vials. When urine was donated both days, combined urine samples were created to minimize within-person variation. The specific gravity (SG) of the urine was measured using a handheld refractometer; total (free plus conjugated species) urinary BPA concentration was measured at the Centers for Disease Control and Prevention using online solid-phase extraction coupled to isotope dilution high-performance liquid chromatography–tandem mass spectrometry.

Urinary BPA concentrations were adjusted for dilution by multiplying values (in µg/L) by \( [(1.014−1)/(SG−1)] \). In the absence of a period effect, we used a paired \( t \) test to examine mean absolute change in SG-adjurined untransformed urinary BPA concentrations (BPA\(_{\text{canned}} \)−BPA\(_{\text{fresh}} \)) because differences were normally distributed, and we calculated confidence intervals for the mean using SAS version 9.2. Statistical tests were 2-sided and performed at the .05 level of significance.

Results. Of 84 volunteers, 75 (89%) completed the study. Median age was 27 years and 51 (68%) were female; median treatment adherence was 100% (TABLE). Bisphenol A was detected in 77% (n = 58) of samples after fresh soup consumption and 100% (n = 75) of samples after canned soup consumption. The SG-adjusted geometric mean concentration of BPA was 1.1 µg/L (95% CI, 0.9-1.4 µg/L) after fresh soup consumption (unadjusted: 0.9 µg/L; 95% CI, 0.7-1.2 µg/L) and 20.8 µg/L (95% CI, 17.9-24.1 µg/L) after canned soup consumption (unadjusted: 17.5 µg/L; 95% CI, 14.1-21.8 µg/L). Stratification by treatment sequence revealed similar values (FIGURE). Following canned soup consumption, SG-adjusted urinary BPA concentrations were, on average, 22.5 µg/L higher (95% CI, 19.6-25.5 µg/L) than those measured after a week of fresh soup consumption (\( P < .001 \)), representing a 1221% increase.

Comment. Consumption of 1 serving of canned soup daily over 5 days was associated with a more than 100% increase in urinary BPA. Generalizability is limited due to selection of participants from 1 school and testing of a single soup brand; however, generalizability to canned goods with similar BPA content is expected. The increase in urinary BPA concentrations following canned soup consumption is likely a transient peak of yet uncertain duration. The effect of such intermittent elevations in urinary BPA concentration is unknown. The absolute urinary BPA concentrations observed following canned soup consumption are among the most extreme reported in a nonoccupational setting. For comparison, the 95th percentile unadjusted urinary BPA in the 2007-2008 National Health and Examination Survey was 13.0 µg/L (95% CI, 10.0-15.4 µg/L). The observed increase in urinary BPA concentrations following canned soup consumption, even if not sustained, may be important, especially in light of available or proposed alternatives to epoxy resins linings for most canned goods.

The involvement of the Centers for Disease Control and Prevention (CDC) was limited and was determined not to constitute engagement in human subjects research.
Additional Contributions: We thank Lori Torf of the Harvard School of Public Health cafeteria for assistance with soup preparation and distribution; Martin Breslin of the Harvard Dining Services for providing the freshly prepared soups; Nikita Jambulingam (Harvard College) for assistance with data collection; and Lily Jia, MS, and Ryan Hennings (National Center for Environmental Health, Centers for Disease Control and Prevention) for technical assistance in measuring urinary BPA. None of the individuals acknowledged were compensated for the contributions.

CORRECTION
Incorrect Number: In the Original Contribution entitled “Association Between Smoking and Risk of Bladder Cancer Among Men and Women,” published in the August 17, 2011, issue of JAMA (2011;306[7]:737-745), an incorrect number was reported in Table 2. Under the column for Women, Person-Years and in the row Former smoker (overall), the number should be 705,925 (not 70,595). This article was corrected online.

Late on the third day, at the very moment when, at sunset, we were making our way [by boat] through a herd of hippopotamuses, there flashed upon my mind, unforeseen and unsought, the phrase, “Reverence for Life.” The iron door had yielded: the path in the thicket had become visible. Now I had found my way to the idea in which affirmation of the world and ethics are contained side by side! Now I knew that the ethical acceptance of the world and of life, together with the ideals of civilization contained in this concept, has a foundation in thought.

—Albert Schweitzer (1875-1965)
