Mr Cahan and colleagues comment on our Viewpoint on the importance of supply optimization in improving the value of health care delivery. We agree with the authors that reducing variability in surgical utilization can be accomplished through consolidating device vendors and integrating purchasing decisions in a way that does not inappropriately drive practice patterns. We only add a caveat that too much consolidation, for example to a single vendor, can increase risk of supply shortages and reduce the opportunity for effective price negotiations.

There are many ways to increase value in health care by focusing on resource use and supply waste. Translational research that identifies and tests best practices for supply optimization in a variety of medical settings would enable more facilities to take advantage of this potential avenue for improvement.
