Picture of the Month

Kimberly A. Horii, MD; Amy Jo Nopper, MD; Vidya Sharma, MBBS, MPH

A RASH (FIGURE 1 AND FIGURE 2) WAS noted in a 2-month-old infant who presented with a 4-week history of erythematous, annular patches and plaques concentrated on the face and periorbital areas. The cutaneous eruption appeared to be asymptomatic, and the infant was otherwise thriving. What is your diagnosis?

Author Affiliations: Section of Dermatology, Children’s Mercy Hospital, Kansas City, Mo.

Figure 1. Erythematous, annular plaques concentrated around the eyes, giving the characteristic “owl’s-eye” appearance.

Figure 2. Lesions seen in profile.
