Initial safety signals for ondansetron are related to a potential increased risk of oral clefts and cardiovascular defects. These initial safety signals were further investigated in controlled observational studies, which formed the basis for the European Medicines Agency’s recommendation that we discussed in our Viewpoint.5 At this point in the evidence-generating process, uncontrolled estimates based on spontaneous reports will not, unfortunately, aid pregnant individuals and their clinicians who need to make complex treatment decisions in the context of uncertainty.

Conflict of Interest Disclosures: None reported.

CORRECTION

Error in the Results Section: In the Original Investigation titled “Trends in Use and Perceptions of Nicotine Vaping Among US Youth From 2017 to 2020,” which published online December 15, 2020,1 there was an error in the Results section. Daily vaping declined from 9% in 2019 to 7% in 2020 instead of 9% in 2020 to 7% in 2019. This article was corrected online.

Error in Author Affiliations: In the Letter to the Editor titled “Providing Neonatal Outcome Estimates as an Intervention,” which published online December 14, 2020,1 there was an error in the author affiliations. Dr Rysavy’s affiliation should be Stead Family Department of Pediatrics, University of Iowa, Iowa City, and Dr Haward’s affiliation should be Department of Pediatrics, Albert Einstein College of Medicine and Children’s Hospital at Montefiore, Montefiore Medical Center, Bronx, New York. This article was corrected online.
